#### Abstract

Multiporphyrin arrays are a complex class of molecules with numerous potential applications in energy transfer, photomedicine and light harvesting. We have developed a facile/versatile route to a class of triptycene linked porphyrin arrays via both Suzuki and Sonogashira cross coupling methods which makes use of the rigid three-pronged orientation of triptycene to construct trimeric porphyrin arrays linked either in the meso or $\beta$-position with various linker groups. In order to understand the properties of these potential antenna systems and probe their potential applications, the coordination behavior of zinc(II) derivatives with mono- and bidentate N -donor ligands was investigated. Depending on ligand concentration, both one- and two-point binding was observed with a bidentate ligand. Also/In addition, different cavity sizes, obtained by the use of different linker groups, resulted in differences in the binding properties of each trimeric system.

## 1. Introduction

Synthetic multiporphyrin arrays can mimic naturally occurring tetrapyrrolic aggregates that are involved in photosynthesis, light harvesting and electron transfer. In nature, the rates of these processes are optimized by organizing the active components at ideal distances and orientations, which is achieved by the use of multiple, non-covalent interactions. ${ }^{1.4}$ Synthetically this can be achieved using multiple covalent and/or coordination bonds which serve to dramatically increase the association constants between components and ensure a well-defined geometry for the resulting complex. ${ }^{5-7}$

Triptycene and its derivatives possess rigid three-dimensional frameworks ${ }^{8-10}$ and thus have potential applications in host-guest complexes, molecular inclusion compounds and coordination compounds with unusual geometries. ${ }^{11-14}$ The $120^{\circ}$ orientation provided by this framework constitutes a useful linker group for multichromophore assemblies. ${ }^{15}$ Consequently, we became interested in using a triptycene unit as a scaffold for the construction of porphyrin arrays with applications in host-guest chemistry. Triptycene was earlier used by us for the preparation of triptycene-quinones for electron transfer studies. ${ }^{16}$

Three types of meso linked triptycenylporphyrin arrays and a $\beta$-linked system were prepared with varying cavity sizes and selected examples were easily metalated with zinc(II). Zinc(II) porphyrins have a simple coordination chemistry and typically
form 1:1 complexes with N -donor ligands. ${ }^{17}$ Thus, we also performed initial investigations into the host-guest chemistry of the zinc(II) triptycenylporphyrin arrays.

## 2. Results and discussion

### 2.1. Syntheses

Triptycene-linked porphyrin trimers were chosen as suitable candidates for multidentate host-guest chemistry and were first synthesized using Pd-catalyzed coupling reactions. ${ }^{8}$ We anticipated that variation of the porphyrin center-to-center distances would allow an investigation of the coordination properties of the rigid trimers. The synthetic route started by preparation of an appropriately functionalized triptycene derivative.

Scheme 2. Synthesis of triptycene-linked porphyrin trimers via Suzuki-Miyaura cross-coupling reaction with 2,6,14-triiodotriptycene and boronylporphyrins.

Commercially available triptycene $\mathbf{1}$ was reacted with nitric acid under reflux according to a procedure by Zhang et al. ${ }^{1}$ A mixture of 2,6,14- and 2,7,14-trinitrotriptycene was obtained, from which the former was isolated in $85 \%$ yield via column chromatography on silica gel with dichloromethane $/ n$-hexane ( $1: 1$ ) as eluent. Reduction of the nitro residues to amino functions yielded 2,6,14-triaminotriptycene in quantitative yield. 2,6,14Triiodotriptycene 2 was obtained from a Sandmeyer reaction using hydrochloric acid, sodium nitrite and potassium iodide (Scheme 1). ${ }^{11}$

Introduction of a boronate or ethyne functionality onto the meso position of a porphyrin would allow subsequent SuzukiMiyaura or Sonogashira coupling reactions of these derivatives. The halogen-bearing moiety 2 would thus be coupled to the respective porphyrins yielding triptycene-linked porphyrin trimers. Several different porphyrin monomers were synthesized bearing a boronic ester, an ethyne and a phenylethyne functionality, respectively.

### 2.1.1. Suzuki reaction

Porphyrins modified at the meso positions were obtained via condensation of pyrrole or a pyrrolic derivative with various aldehydes. $\mathrm{A}_{2}$-type porphyrins with two unsubstituted meso positions available for further functionalization, were synthesized from the respective dipyrromethane precursor following a procedure developed by Lee and Lindsey. ${ }^{12}$ A nucleophilic substitution reaction ${ }^{13}$ yielded trisubstituted $\mathrm{A}_{2} \mathrm{~B}$-type porphyrins. Subsequent bromination of the porphyrins with N bromosuccinimide (NBS) then yielded the porphyrin precursors 3a to 6a. meso-Boronylation was performed according to a procedure by Therien and coworkers (Scheme 2). ${ }^{14}$ For example, the reaction of $5 \mathbf{a}$ and $\mathbf{6 a}$ with 4,4,5,5-tetramethyl-1,3,2dioxaborolane proceeded as expected in 12 hours. Debromination of the starting material was a competing reaction. Thus, a 10 -fold
excess of pinacolborane was used to ensure a high yield of the boronate porphyrins $5 \mathbf{b}(56 \%)$ and $\mathbf{6 b}(80 \%)$.

Next, the boronate porphyrins were reacted with $2,6,14-$ triiodotriptycene 2 using the conditions described by Chng et al. for the preparation of a dibenzofurane-linked porphyrin dimer: ${ }^{15}$ The Suzuki cross-coupling reaction ${ }^{16}$ yielded the respective triporphyrin triptycene derivatives $\mathbf{3 - 6}$ c. Slightly better yields were obtained for coupling of the free-base porphyrin $7 \mathbf{b}$ as compared to the conversion of $\mathbf{5 b}$ due to difficulties in purification of the zinc(II) tricoupled products. The free-base trimer 7c could be metalated in situ with zinc(II) acetate to give the zinc(II) trimer 5c in quantitative yield.

The methodology established above was also applicable to the preparation of triptycene-porphyrin trimers with the porphyrins
joined to the linker unit/triptycene backbone in a $\beta$-position. Porphyrin dimers and trimers with meso $-\beta$ and $\beta-\beta$ linkage ${ }^{17,18}$ have been intensely studied in recent years, especially due to their rewarding stereochemical features and unique structural chemistry ${ }^{18}$ or their fundamental use in electron transfer. ${ }^{17 \mathrm{~b}}$ Using a procedure similar to the one applied to meso functionalized porphyrins $\beta$-linked porphyrin triptycene systems were accessible as well, albeit in lower yield due to the increased sterical hindrance at the coupling position. For example, 2-([1', $\left.3^{\prime}, 2^{\prime}\right]-$ dioxaborolan- $2^{\prime}$-yl)-5,10,15,20-tetraphenylporphyrin (structure not shown ${ }^{18, \mathrm{a}, \mathrm{b}}$ was reacted with 2 in the presence of $\mathrm{Ba}(\mathrm{OH})_{2}$ and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ giving the triptycene derivative $\mathbf{8}$ in $10 \%$ yield.

### 2.1.2. Sonogashira reaction

Precursors of the Sonagashira coupling reaction ${ }^{19}$ required an ethyne moiety to react with the triiodotriptycene. The porphyrin monomer $9 \mathbf{a}$ was synthesized by a mixed condensation reaction ${ }^{20}$ of pyrrole with two different aldehydes. Here, 3-(trimethylsilyl) propiolaldehyde served as the reactive aldehyde, whereas, $p$ tolylaldehyde was chosen because of its availability and enhanced solubility of $p$-tolyl-substitued porphyrin as compared to the respective phenyl derivatives, thus aiding chromatography. Following a procedure by Seo et al., ${ }^{21}$ pyrrole, $p$-tolylaldehyde and 3-(trimethylsilyl)propiolaldehyde were condensed in a 4:2.1:2 ratio to yield 9a. Deprotection of the ethyne group with tetrabutylammonium fluoride (TBAF) then gave the ethynylsubstituted porphyrin $\mathbf{9 b}$.

Scheme 3. Sonogashira coupling reaction of 2,6,14-triiodotriptycene with ethynyl functionalized porphyrins.

For preparation of a porphyrin with a phenylethyne functionality we initially attempted a mixed condensation procedure previously reported by Fazio et al. ${ }^{22}$ However, for our target system isolation of the products turned out to be difficult due to the similar polarities of the components of the mixtures. Thus, the 4-ethynylphenyl residue was introduced into 5,15 -ditolylporphyrin $\mathbf{1 0 a}^{23}$ by a nucleophilic substitution reaction. ${ }^{13}$ 1-Bromo-4-ethynylbenzene was reacted with $n$ butyllithium under inert conditions, to yield the desired organolithium reagent. Addition of 5,15-ditolylporphyrin 10a in THF yielded the desired free base product in $69 \%$ yield. Subsequent treatment with zinc(II) acetate gave the zinc(II) porphyrin monomer 10b. ${ }^{24}$

Sonogashira coupling reactions have commonly been used for the synthesis of porphyrin multicomponent systems. ${ }^{25}$ The palladium coupling conditions are reasonably attractive as they are performed in neutral to basic conditions, where demetalation does not occur. However, using copper as a co-catalyst, and under specific conditions, transmetalation can occur with the zinc(II)porphyrin. In agreement with Farina et al. who reported an improved rate of the Stille reaction upon addition of triphenylarsine, ${ }^{26 a}$ Lindsey et al. successfully outlined the conditions for a copper-free Sonogashira reaction involving triphenylarsine and tris(dibenzylideneacetone)dipalladium (0). ${ }^{266}$ Thus, under mild, non-acidic, non-metalating conditions, the zinc(II) porphyrins 9b and 10b were coupled with $2,6,14-$ triiodotriptycene to yield the desired ethynyl- and phenylethynyllinked porphyrin trimers 9c (28\%) and 10c (36\%) (Scheme 3).

### 2.2. Host-guest properties

In order to understand the behavior of the trimer complexes 5c, 9c and 10c upon ligand coordination, investigations by UV/vis spectroscopy were first carried out to determine how the bidentate ligand, 4, ${ }^{\prime}$-bipyridine (bipy) coordinated to a monomeric metalloporphyrin (5,10,15,20-tetramesitylporphyrinato)zinc(II). UV/vis spectroscopy has been used to elucidate the stoichiometry of binding, binding constants and a limited amount of structural information. Previous studies showed that upon coordination of an N -donor ligand to a zinc(II) porphyrin, a bathochromic shift of about 10 nm occurred in the Soret region/ the Soret band is red-shifted by about 10 nm indicating a 1:1 binding stoichiometry. ${ }^{27,28}$ In addition, ${ }^{1} \mathrm{H}$ NMR spectroscopy had shown that at millimolar concentrations a $2: 1$ porphyrin/ligand sandwich complex was formed upon addition of 0.5 equiv. of a bidentate ligand,. ${ }^{29}$ The $2: 1$ complex then opens up to give the $1: 1$ open complex in the presence of excess ligand.

The addition of incremental amounts of bipy to ( $5,10,15,20-$ tetramesitylporphyrinato)zinc(II) $\left(\varepsilon=756,600 \quad \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$ in dichloromethane resulted in a Soret band shift from 420 to 428 $\mathrm{nm}(\Delta \lambda=8 \mathrm{~nm})$ with one distinct isosbestic point at 424 nm , clearly indicating an equilibrium between two defined species (Fig. 1). ${ }^{30}$ The titration data were analysed using the nonlinear regression analysis program Specfit ${ }^{\mathrm{TM}}$ which analyses the entire series of spectra simultaneously. ${ }^{31}$ The best/optimum data fit was obtained for/when applying a $1: 1$ binding model and resulted in a binding constant of $\log K_{1: 1}=4.4 \pm 0.004$, which was expected for the formation of an open complex. ${ }^{27,28}$

UV/vis experiments were carried out on trimers 5c, 9c and 10c with mono- and bidentate ligands to determine the coordination properties of these rigid porphyrin arrays. Bidentate ligands are capable of displaying multiple binding interactions with these porphyrin trimers (Fig. 2). Previous UV/vis and ${ }^{1} \mathrm{H}$ NMR investigations on porphyrin systems have revealed that dimeric
bridging ligand complexes preferentially adapt the bridged structure at low concentrations of ligand, in spite of the fact that the endo side is considerably more accessible than the exo side. ${ }^{28,32}$ Using/In ${ }^{1} \mathrm{H}$ NMR spectroscopy, this phenomenon was reflected in/resulted in a high-field resonance at $\delta=-5 \mathrm{ppm}$ for the $\mathrm{CH}_{2}$ protons of a 1,4-diazabicyclo[2.2.2]octane ligand (DABCO) tightly bound to two zinc(II) porphyrins, which was completely absent when monodentate ligands were used. ${ }^{27,28,33}$ Monomeric and dimeric binding have also been differentiated using UV/vis spectroscopy. Formation of a 1:1 dimer/ligand sandwich complex was accompanied by a 5 nm red-shift, compared to a 10 nm red-shift in the 1:2 open system which was observed with the addition of excess ligand. ${ }^{27}$ Also, association constants determined from UV/vis titrations for the formation of dimeric sandwich complexes are much greater than those for the corresponding monodentate binding motifs. ${ }^{34}$

Figure 1. Changes in the absorption spectra (Soret band spectral region) of (5,10,15,20-tetramesitylporphyrinato)zinc(II) ( $1.34 \times 10^{-6} \mathrm{M}$ ) recorded in dichloromethane, upon addition of bipy. Inset: The changes at 428 nm with a $1: 1$ fit ( 0 to 6,000 equiv.).

Therefore, a bidentate ligand such as bipy, is capable of forming a 1:1 trimer/ligand sandwich complex (Fig. 2a), a 1:2 complex, displaying both sandwich and open complexation (Fig. 2 b ), and a 1:3 trimer ligand complex, where all ligands are bound in an open complex (Fig 2c).

Figure 2. Schematic representation of the species in the equilibria of binding bipy to a trisporphyrin.

### 2.2.1. Directly linked porphyrin trimer 5c

Figure 3. The changes in the absorption spectra (Soret region) of the directly linked trimer $5 \mathbf{c}\left(8 \times 10^{-7} \mathrm{M}\right)$ upon addition of bipy, recorded in dichloromethane. Inset: The changes at 433 nm fit to a five-component system.

The absorption spectrum of the directly linked trimer 5c ( $\varepsilon=$ $816,000 \mathrm{M}^{-1} \mathrm{~cm}^{-1}$ ) exhibited a $\lambda_{\text {max }}$ at 424 nm with a shoulder at 417 nm . This was indicative of a slight electronic interaction between the porphyrin components. ${ }^{35}$ Upon titration of 5c with bipy in dichloromethane, two new transitions formed at 430 ( $\Delta \lambda$ $=6 \mathrm{~nm})$ and $433 \mathrm{~nm}(\Delta \lambda=9 \mathrm{~nm})$, with isosbestic points at 427 and 428 nm , respectively (Fig. 3). Titration with pyridine resulted in a 9 nm bathochromic shift (Table 1), thus confirming that the final species in the $\mathbf{5 c}$ /bipy solution was the 1:3 open complex.

Table 1. The absorption maxima and binding constants for the complexation between 5 c and mono- and bidentate ligands.

|  | $\lambda_{\text {maz }}(\mathrm{nm})$ | $\log K_{1: 1}$ | $\log K_{1: 2}$ | $\log K_{1: 3}$ |
| :--- | :--- | :--- | :--- | :--- |
| $\mathbf{5 c}$ | $\mathbf{4 2 4}, 548,587$ |  |  |  |
| $\mathbf{5 c}+$ bipy | $433,563,602$ | $5.3 \pm 0.03$ | $5.4 \pm 0.03$ | $3.3 \pm 0.02$ |
| $\mathbf{5 c}+$ pyr | $433,563,602$ | $4.8 \pm 0.18$ | $4.1 \pm 0.22$ | $3.4 \pm 0.23$ |

Figure 4. The species distribution plot of the directly linked trimer $5 \mathbf{c}\left(8 \times 10^{-}\right.$ ${ }^{7} \mathrm{M}$ ) upon the addition of bipy recorded in dichloromethane 0 to 60 equiv.

The changes in the spectra with increasing concentrations of bipy were best described by a five-component system (host, guest, 1:1 host/guest, 1:2 host/guest and 1:3 host/guest) after fitting by Specfit ${ }^{\text {TM }}$, the fit of which is shown as an inset in Figure 3. The 6 nm red-shift relative to the absorption of the uncomplexed trimer was attributed to the 1:2 trimer/ligand complex (Fig. 2b) since it seemed unlikely that the zinc(II) metal would remain four-coordinate in the presence of excess bipy. The binding constants for this fit are shown in Table 1.

The binding constants for the $1: 1$ and $1: 2$ species were of similar magnitude and indicated the formation of the more stable
sandwich complexes. The species distribution plot for the fivecomponent system (Fig. 4) revealed a simultaneous formation of the $1: 1$ and 1:2 trimer/ligand species at low concentrations of bipy.

### 2.2.2. Ethyne linked porphyrin trimer 9c

The spectra for compound $9 \mathrm{c}\left(\varepsilon=996,400 \mathrm{M}^{-1} \mathrm{~cm}^{-1}\right)$ exhibited a $\lambda_{\text {max }}$ at 443 nm . Upon titration with bipy, a new transition at 449 nm developed and an isosbestic point at 444 nm was identified (Fig. 5). Upon the formation of a $1: 1$ complex, the monomer exhibited an 8 nm red-shift. In the case of dimeric ligands, the formation of a $1: 1$ open complex was accompanied by a 10 nm red-shift, whereas the formation of a sandwich complex resulted in a 5 nm red-shift. ${ }^{28,29,32 \mathrm{a}, 32 \mathrm{~b}, 32 \mathrm{~d}}$ However, titration with pyridine resulted in an overall bathochromic shift of 6 nm (Table 2).

Table 2. The absorption maxima and binding constants for the complexation between 5c and mono- and bidentate ligands.

|  | $\lambda_{\text {maz }}(\mathrm{nm})$ | $\log K_{1: 1}$ | $\log K_{1: 2}$ | $\log K_{1: 3}$ |
| :--- | :--- | :--- | :--- | :--- |
| 8c | $443,567,614$ |  |  |  |
| 8c + bipy | $449,582,635$ | $6.18 \pm 0.01$ | $5.14 \pm 0.09$ | $3.79 \pm 0.09$ |
| 8c + pyr | $449,581,636$ | $4.62 \pm 0.10$ | $3.95 \pm 0.17$ | $3.43 \pm 0.14$ |

The binding constants for the formation of the $1: 1$ and $1: 2$ 9c/bipy complexes were considerably higher than for the formation of the $9 \mathrm{c} / \mathrm{pyr}$ complexes, and indicated the formation of sandwich-type complexes with the bidentate ligand. The changes in the spectra were therefore attributed to a five component system (Host, guest and 1:1, 1:2 and 1:3 host/guest complexes). The binding isotherm is shown as an inset in Figure 5.

Figure 5. UV/vis titration (Soret region) of the ethyne-linked trimer 9c (9.2 $\times$ $10^{-7} \mathrm{M}$ ) with bipy recorded in dichloromethane ( 0 to 70,000 equiv.). Inset: The changes at 449 nm with a $1: 2$ trimer/ligand fit ( 0 to 500 equiv.).

The species distribution diagram in Figure 6 obtained from the fit showed that the $1: 1$ complex reached $62 \%$ formation at only 1 equivalent of ligand per porphyrin. The 1:2 complex became the main species in solution after the addition of 3 equiv. of ligand, whereas the $1: 3$ species was predominant in solution after the addition of almost 60 equiv. of bidentate ligand.

Figure 6. The species distribution diagram of the ethyne-linked trimer 9c $\left(9.22 \times 10^{-7} \mathrm{M}\right)$ upon the addition of bipy ( 0 to 500 equiv.) recorded in dichloromethane.

### 2.2.3. Phenylethynyl-linked trimer 10c

In the case of the phenylethynyl linked porphyrin trimer 10c ( $\varepsilon=958,100 \mathrm{M}^{-1} \mathrm{~cm}^{-1}$ ), the addition of bipy resulted in a decrease in the absorption at 415 nm while a new band appeared at 422 nm , with an isosbestic point at 419 nm (Fig. 7). With the addition of further equivalents of bipy, a second isosbestic point was identified at $421 \mathrm{~nm}(\Delta \lambda=6 \mathrm{~nm})$, and a final absorption with a $\lambda_{\text {max }}$ at $425(\Delta \lambda=10 \mathrm{~nm})$ resulted. This was comparable to UV/vis investigations carried out with pyridine, where a new absorption at $425 \mathrm{~nm}(\Delta \lambda=10 \mathrm{~nm})$ was observed with a single isosbestic point at 420 nm . This confirmed the final species in the trimer/bipy solution to be the 1:3 open complex. Using Specfit ${ }^{\text {TM }}$ the changes in the absorption spectra upon titration with bipy were assigned to a five-component system (host; guest; and 1:1; 1:2 and 1:3 trimer/ligand complexes). The binding isotherm is shown as an inset in Figure 7.

Figure 7. UV/vis titration spectra (Soret region) of the phenylethynyl-linked trimer 10c ( $1.13 \times 10-6 \mathrm{M}$ ) with bipy recorded in dichloromethane (from 0 to 5,000 equiv.). Inset: The binding isotherm with $1: 3$ trimer/ligand fit, which was determined using SpecfitTM, at 425 nm (0 to 1,000 equiv.). ${ }^{36}$

The binding constants obtained for this fit are shown in Table 3. The binding constant for the formation of the $1: 1$ complex was greater than the latter two, indicating the formation of the more stable sandwich complex. The 6 nm red shift was attributed to the formation of a 1:2 trimer/ligand complex, whereas the overall red-shift of 10 nm relative to the original trimer absorption was consistent with the formation of the $1: 3$ open complex.

Table 3. The absorption maxima and binding constants for the complexation between 10c and mono- and bidentate ligands.

|  | $\lambda_{\text {maz }}(\mathrm{nm})$ | $\log K_{1: 1}$ | $\log K_{1: 2}$ | $\log K_{1: 3}$ |
| :--- | :--- | :--- | :--- | :--- |
| 10c | $415,542,578$ |  |  |  |
| 10c bipy | $425,557,595$ | $5.1 \pm 0.01$ | $3.7 \pm 0.07$ | $3.9 \pm 0.07$ |
| 10c pyr | $425,556,596$ | $3.5 \pm 0.08$ | $3.3 \pm 0.17$ | $3.5 \pm 0.09$ |

The speciation diagram in Figure 8 depicted $69 \%$ formation of the $1: 1$ ligand/trimer complex at 11 equivalents of bipy per porphyrin. The 1:2 and 1:3 trimer/ligand species were formed simultaneously, with the former reaching its maximum concentration at 53 equiv. of guest. Both species had similar binding constants and were consistent with external complexation. ${ }^{34}$

Figure 8. The species distribution plot of the phenylethynyl-linked trimer 10c $\left(1.13 \times 10^{-6} \mathrm{M}\right)$ upon addition of bipy recorded in dichloromethane.

## 3. Conclusions

2,6,14-Trisubstiuted triptycenylporphyrins were synthesized in yields up to $36 \%$ both via Suzuki and Sonogashira coupling reactions. The porphyrin precursors were prepared by nucleophilic addition reactions of $\mathrm{A}_{2}$-type porphyrins or mixed condensation reactions and linked to the triptycene core either through the meso or $\beta$ position. The systems investigated provide a proof of concept for the construction of larger porphyrin arrays based on/with a rigid triptycene core.

Preliminary studies were performed to investigate the host/guest properties of the triptycene-linked porphyrin trimers. Complexation experiments with the trimers and bidentate 4,4'bipyridine were performed and binding constants were determined using Specfit ${ }^{\mathrm{TM}}$. Pyridine, a monondentate ligand, was used for a comparative study. In each array, the binding constants for the formation of the 1:1 complex were greater by an order of magnitude with 4,4'-bipyridine compared with pyridine. This was consistent with intramolecular sandwich-type complexation. Larger binding constants were also obtained for the formation of the $1: 2$ trimer/ligand complexes of $\mathbf{9 c}$ and 10c with bipy, whereas $5 \mathbf{c}$, displayed a comparable value for both bipy and pyr.

An intermediate species was detected for compounds 5 c and 9c and was 6 nm red shifted from the uncoordinated porphyrin array. This was assigned to the 1:2 trimer/ligand complex which displayed both sandwich and open binding interactions At higher concentration of bipy, overall red-shifts of $9 / 10 \mathrm{~nm}$ was observed. These shifts were comparable to results obtained with pyridine and were consistent with the formation of a $1: 3$
trimer/ligand open complex. Compound 8c displayed different behavior: An intermediate species, with a clear set of isosbestic points could not be detected and a red-shift of 6 nm was observed in the presence of excess ligand. A comparison with pyridine confirmed that the final species was in fact the 1:3 open complex.

The types of trimers presented herein have not been investigated previously. They are not fully symmetric and, consequently, both sandwich and open complexation were observed simultaneously in titrations with bipy. Previous investigations on the coordination chemistry of multiporphyrin arrays focused either on fully symmetric systems, whereby sandwich and/or open complexes were observed sequentially, ${ }^{28,29,32,37}$ or on dendrimer-type systems where the intermediate complexes could not be decisively classified. ${ }^{38}$

## 4. Experimental

### 4.1. General information

${ }^{1} \mathrm{H}$ NMR spectra were recorded on a Bruker DPX 400 (400 MHz for ${ }^{1} \mathrm{H}$ NMR and 100.6 for ${ }^{13} \mathrm{C}$ NMR). Chemical shifts are reported in (ppm) referenced to tetramethylsilane set at 0.00 ppm . HRMS spectra were measured on Micromass/Waters Corp. USA liquid chromatography timer-of-flight spectrometer equipped with ES source. Low resolution mass spectra were recorded on Micromass/Waters Corp. USA Quattro micro_LC-MS>MS. UV/vis measurements were performed on a Perkin Elmer, Lambda 1050 spectrophotometer or a Perkin Elmer, Lambda 25 spectrophotometer. Melting points were acquired on a Stuart SMP10 melting point apparatus and are uncorrected. Thin layer chromatography (TLC) was performed on silica gel $60 \mathrm{~F}_{254}$ (Merck) precoated aluminum sheets. Flash chromatography was carried out using Fluka Silica Gel 60 (230-400 mesh). Anhydrous THF distilled over sodium/benzophenone was used. All commercial chemicals were supplied by Aldrich and used without purification. UV/vis titrations were performed with a Perkin Elmer, Lambda 1050 spectrophotometer or with a Perkin Elmer, Lambda 25 spectrophotometer. Solutions of porphyrins were prepared in spectrophotometric grade dichloromethane (Aldrich). Analytical data for compounds $\mathbf{2},{ }^{1} \mathbf{4 a},{ }^{40} \mathbf{5 a},{ }^{41} \mathbf{7 a} \mathbf{a}^{39} \mathbf{9 a},{ }^{21}$ $\mathbf{9 b},{ }^{21} \mathbf{1 0 a}{ }^{23}$ and $\mathbf{1 0 b}{ }^{24}$ agree with those reported in the literature and related compounds. ${ }^{40}$

### 4.2. Syntheses

4.2.1.
[5-Bromo-15-(n-butyl)-10,20-bis(4methylphenyl)porphyrinato]zinc(II) (6a)

Porphyrin 3a was metalated using $\mathrm{Zn}(\mathrm{OAc})$ according to a procedure by Tomizaki et al. ${ }^{41}$ to yield a purple solid: $(204.5 \mathrm{mg}$, $93 \%): \mathrm{mp}>300{ }^{\circ} \mathrm{C} ; \mathrm{R}_{\mathrm{f}}=0.31\left(\mathrm{SiO}_{2}\right.$, dichloromethane $/ n$-hexane, $1: 2, \mathrm{v} / \mathrm{v}) ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=1.15\left(\mathrm{t},{ }^{3} J=7.3 \mathrm{~Hz}\right.$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), $1.84\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 2.49(\mathrm{~m}, 2 \mathrm{H}$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), 2.77 ( $\mathrm{s}, 6 \mathrm{H}$, tolyl- $\mathrm{CH}_{3}$ ), 4.82 ( $\mathrm{t},{ }^{3} \mathrm{~J}=8.0 \mathrm{~Hz}$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), $7.60\left(\mathrm{~d},{ }^{3} \mathrm{~J}=7.6 \mathrm{~Hz}, \mathrm{Ar}-\mathrm{H}\right), 8.05\left(\mathrm{~d},{ }^{3} \mathrm{~J}=7.8 \mathrm{~Hz}\right.$, Ar-H), $8.94\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{H}_{\beta}\right), 9.41\left(\mathrm{~d},{ }^{3} J=4.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}_{\beta}\right), 9.65 \mathrm{ppm}$ $\left(\mathrm{d},{ }^{3}{ }^{J}=4.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{H}_{\beta}\right) ;{ }^{13} \mathrm{C}$ NMR ( $150.9 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=14.2$, $21.6,23.7,35.4,41.1,103.5,121.1,122.2,127.3,129.0,132.4$, $132.5,133.1,134.4,137.2,139.6,149.6,149.6,150.0,150.3$ ppm; UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ : $\lambda_{\text {max }}(\lg \varepsilon)=423$ (5.6), $554(4.5), 592 \mathrm{~nm}$ (4.3); HRMS (ES+) $\left[\mathrm{C}_{38} \mathrm{H}_{31} \mathrm{~N}_{4} \mathrm{BrZn}\right]$ calcd for [M+H], 686.1024, found 686.1013.
4.2.2. $\left[5-\left(4^{\prime}, 4^{\prime}, 5^{\prime}, 5^{\prime}\right.\right.$-Tetramethyl-\{ $\left.1^{\prime}, 3^{\prime}, 2^{\prime}\right\}$ dioxaborolan- $\left.2^{\prime}-y l\right)$ -10,15,20-triphenylporphyrinato]nickel(II) (3b)

The bromoporphyrin 3a ( 1 eq.) was placed in a Schlenk tube and dried under vacuum. Dry 1,2-dichloroethane ( 20 ml ) and dry triethylamine ( 13 eq.) were added under argon. The solution was
degassed via three freeze-pump-thaw cycles, before the vessel was purged with argon. 4,4,5,5-Tetramethyl-1,3,2-dioxaborolane (10 eq.) and dichlorobis(triphenylphosphine)palladium(II) (0.03 eq) were then added, and the Schlenk tube was sealed and stirred at $90^{\circ} \mathrm{C}$ overnight. The reaction was quenched carefully with a saturated KCl solution, washed with water, and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed under reduced pressure. The crude product was purified by column chromatography on silica gel dichloromethane $/ n$-hexane ( $1: 2, \mathrm{v} / \mathrm{v}, \mathrm{h}=31 \mathrm{~cm}, \varnothing=6 \mathrm{~cm}$ ) and gave the pure product as second fraction as purple crystals after recrystallization from dichloromethane/methanol, yield: $201.5 \mathrm{mg} \quad(0.28 \mathrm{mmol}, 51 \%): \mathrm{mp}=230{ }^{\circ} \mathrm{C} ; \quad R_{f}=0.53$ (dichloromethane $/ n$-hexane, 1:1, v/v); ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\mathrm{CDCl}_{3}$ ): $\delta=1.72 \mathrm{ppm}\left(\mathrm{s} .12 \mathrm{H}, \mathrm{CH}_{3}\right), 7.71(\mathrm{~m}, 9 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 8.02(\mathrm{~m}$, $6 \mathrm{H}, \mathrm{Ar}-H), 8.70\left(\mathrm{~d}, 2 \mathrm{H},{ }^{3} J=4.9 \mathrm{~Hz}, H_{\beta}\right), 8.74\left(\mathrm{~d}, 2 \mathrm{H},{ }^{3} J=4.9 \mathrm{~Hz}\right.$, $\left.H_{\beta}\right), 8.86\left(\mathrm{~d}, 2 \mathrm{H},{ }^{3} J=5.1 \mathrm{~Hz}, H_{\beta}\right), 9.79 \mathrm{ppm}\left(\mathrm{d}, 2 \mathrm{H},{ }^{3} J=5.1 \mathrm{~Hz}\right.$, $H_{\beta}$ ); ${ }^{13} \mathrm{C}$ NMR ( $100.6 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=24.73,84.39,118.25$, 126.38, 127.23, 127.29, 131.12, 131.86, 132.61, 133.18, 133.26, 133.54, 140.33, 140.44, 141.25, 141.45, 142.48, 146.44 ppm ; $\mathrm{UV} / \mathrm{vis}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\text {max }}(\lg \varepsilon)=413$ (5.27), 528 (4.21), 569 nm (3.78); HRMS (ES+) $\left[\mathrm{C}_{44} \mathrm{H}_{35} \mathrm{BN}_{4} \mathrm{NiO}_{2}\right]$ : calcd for [M+H] 721.2285, found 721.2272.
4.2.3. 5-Butyl-15-(4',4',5',5'-tetramethyl-[1', 3',2']dioxaborolan-2'-yl)-10,20-bis(4-methylphenyl)porphyrin (4b)

Prepared by reaction of 5-bromo-15-butyl-10,20ditolylporphyrin 4a following the procedure in 4.2.2. The crude product was purified by column chromatography on silica gel dichloromethane $/ n$-hexane ( $1: 2, \mathrm{v} / \mathrm{v}$ ) and gave the pure product as second fraction as purple crystals after recrystallization from dichloromethane/methanol ( $207.3 \mathrm{mg}, 0.308 \mathrm{mmol}$ ) in $48 \%$ yield: $\mathrm{mp}=260^{\circ} \mathrm{C} ; R_{f}=0.37$ (dichloromethane $/ n$-hexane, $1: 1, \mathrm{v} / \mathrm{v}$ ); ${ }^{1} \mathrm{H}$ NMR $\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \quad \delta=1.14\left(\mathrm{t},{ }^{3} \mathrm{~J}=7.4 \mathrm{~Hz}, 3 \mathrm{H}\right.$, $\left.\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.84\left(\mathrm{~s}, 14 \mathrm{H}, \mathrm{CH}_{3}+\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 2.55(\mathrm{~m}, 2 \mathrm{H}$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 2.76 (s, 6 H , tolyl- $\mathrm{CH}_{3}$ ), $5.04\left(\mathrm{t},{ }^{3} \mathrm{~J}=7.9 \mathrm{~Hz}, 2 \mathrm{H}\right.$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), $7.59\left(\mathrm{~d},{ }^{3} J=7.8 \mathrm{~Hz}, 4 \mathrm{H}, \mathrm{Ar}_{H}\right), 8.10\left(\mathrm{~d},{ }^{3} J=7.8\right.$ $\left.\mathrm{Hz}, 4 \mathrm{H}, \mathrm{Ar}_{H}\right), 8.92\left(\mathrm{~d},{ }^{3} J=4.8 \mathrm{~Hz}, 2 \mathrm{H}, H_{\beta}\right), 8.95\left(\mathrm{~d},{ }^{3} J=4.8 \mathrm{~Hz}\right.$, $\left.2 \mathrm{H}, H_{\beta}\right), 9.49\left(\mathrm{~d},{ }^{3} J=4.8 \mathrm{~Hz}, 2 \mathrm{H}, H_{\beta}\right), 9.82 \mathrm{ppm}\left(\mathrm{d},{ }^{3} J=4.8 \mathrm{~Hz}\right.$, $2 \mathrm{H}, H_{\beta}$ ) ${ }^{13} \mathrm{C}$ NMR ( $100.6 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=14.24,21.58,23.71$, $25.33,35.28,40.94,85.06,119.58,122.50,127.29,134.45$, 137.24, 139.67 ppm ; UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\text {max }}(\lg \varepsilon)=417(5.35)$, 517 (4.22), 549 (3.79), 589 (3.77), 644 nm (3.53); HRMS (ES+) $\left[\mathrm{C}_{44} \mathrm{H}_{45} \mathrm{BN}_{4} \mathrm{O}_{2}\right]$ : calcd for $[\mathrm{M}+\mathrm{H}] 673.3714$, found 673.3685 .
4.2.4. [5-(4', $4^{\prime}, 5^{\prime}, 5^{\prime}$-Tetramethyl-\{ $\left\{1^{\prime}, 3^{\prime}, 2^{\prime}\right\}$ dioxaborolan- $\left.2^{\prime}-y l\right)$ -10,15,20-triphenylporphyrinatolzinc(II) (5b)

Produced from bromoporphyrin 5a following the procedure in 4.2.2. The crude product was purified by column chromatography on silica gel dichloromethane $/ n$-hexane ( $1: 2$, $\mathrm{v} / \mathrm{v}, \mathrm{h}=24 \mathrm{~cm}, \varnothing=3 \mathrm{~cm}$ ) and gave the pure product as second fraction as purple crystals after recrystallization from dichloromethane/methanol, yield: $241.1 \mathrm{mg}, 56 \%)$ : $\mathrm{mp}=148{ }^{\circ} \mathrm{C}$; $R_{f}=0.17$ (dichloromethane $/ n$-hexane, $1: 1, \mathrm{v} / \mathrm{v}$ ); ${ }^{1} \mathrm{H}$ NMR ( 400 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=1.83\left(\mathrm{~s}, 12 \mathrm{H}, \mathrm{CH}_{3}\right), 7.72\left(\mathrm{~m}, 9 \mathrm{H}, \mathrm{Ar}_{H}\right), 8.17(\mathrm{~m}$, $6 \mathrm{H}, \mathrm{Ar}_{H}$ ), $8.83\left(\mathrm{~d},{ }^{3} J=4.7 \mathrm{~Hz}, 2 \mathrm{H}, H_{\beta}\right) 8.85\left(\mathrm{~d},{ }^{3} J=4.9 \mathrm{~Hz}, 2 \mathrm{H}\right.$, $\left.H_{\beta}\right), 8.99\left(\mathrm{~d},{ }^{3}=4.7 \mathrm{~Hz}, 2 \mathrm{H}, H_{\beta}\right), 9.83\left(\mathrm{~d},{ }^{3} J=4.7 \mathrm{~Hz}, 2 \mathrm{H}, H_{\beta}\right)$ ppm; ${ }^{13} \mathrm{C}$ NMR ( $100.6 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=25.02,84.91,120.64$, 122.30, 126.20, 127.13, 127.19, 131.24, 131.85, 132.56, 132.69, 134.02, 134.17, 142.44, 142.55, 149.02, 149.69, 150.09, 154.10 ppm; UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\text {max }}(\lg \varepsilon)=417$ (5.13), 546 (4.27), 581 nm (3.57); HRMS (ES+ $)\left[\mathrm{C}_{44} \mathrm{H}_{35} \mathrm{BN}_{4} \mathrm{O}_{2} \mathrm{Zn}\right]$ calcd for [M+H] 727.2223, found 727.2206.
4.2.5.
[5-Butyl-15-(4', $4^{\prime}, 5^{\prime}, 5^{\prime}$-tetramethyl[ 1 ', 3',2 ']dioxaborolan- 2 '-yl)-10,20-bis(4-
methylphenyl)porphyrinato)zinc(II) (6b)
The reaction followed the procedure given in 4.2.2. However,
prior to purification metallation with zinc(II) acetate was performed on the crude product. Filtration through a frit using silica gel and dichlormethane $/ n$-hexane ( $1 / 1, \mathrm{v} / \mathrm{v}$ ) eluted the debrominated porphyrin side product. Changing the eluent to dichloromethane yielded the title compound $\mathbf{6 b}$ as a purple solid ( $390.4 \mathrm{mg}, 80 \%$ for two steps): $\mathrm{mp}>300{ }^{\circ} \mathrm{C} ; R_{f}=0.51$ (dichloromethane $/: n$-hexane, $1: 1, \mathrm{v} / \mathrm{v})$; ${ }^{1} \mathrm{H}$ NMR ( 400 MHz , $\mathrm{CDCl}_{3}$ ): $\delta=1.17\left(\mathrm{t},{ }^{3} J=7.4 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right.$ ), $1.90(\mathrm{~m}$, $14 \mathrm{H}, \mathrm{CH}_{3}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), $2.54\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right.$ ), $2.79\left(\mathrm{~s}, 6 \mathrm{H}\right.$, tolyl- $\left.\mathrm{CH}_{3}\right), 4.92\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 7.62(\mathrm{~d}$, $\left.{ }^{3} J=7.2 \mathrm{~Hz}, 4 \mathrm{H}, \operatorname{Ar}-H\right), 8.13\left(\mathrm{~d},{ }^{3} J=7.3 \mathrm{~Hz}, 4 \mathrm{H}, \mathrm{Ar}-H\right), 9.05(\mathrm{~m}$, $\left.4 \mathrm{H}, H_{\beta}\right), 9.50\left(\mathrm{~m}, 2 \mathrm{H}, H_{\beta}\right), 9.91 \mathrm{ppm}\left(\mathrm{m}, 2 \mathrm{H}, H_{\beta}\right) ;{ }^{13} \mathrm{C}$ NMR ( $150.9 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=14.2,21.5,23.8,25.3,35.6,41.2,85.1$, 120.4, 123.2, 127.7, 128.9, 131.8, 132.9, 134.4, 137.0, 140.1, 149.2, 149.7, 150.0, 154.6 ppm ; UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\text {max }}(\mathrm{lg}$ $\varepsilon)=419$ (5.7), 548 (4.5), 585 nm (4.1); HRMS(ES+) [ $\left.\mathrm{C}_{44} \mathrm{H}_{43} \mathrm{~N}_{4} \mathrm{O}_{2} \mathrm{Zn}\right]$ calcd for $[\mathrm{M}+\mathrm{H}] 734.2771$, found 734.2749.

### 4.2.6. 5-(4', $4^{\prime}, 5^{\prime}, 5^{\prime}$-Tetramethyl-[1', $\left.3^{\prime}, 2^{\prime}\right]$ dioxaborolan-2'-yl)-10,15,20-triphenylporphyrin (7b)

5-Bromo-10,15,20-triphenylporphyrin 7a ( $400 \mathrm{mg}, 0.65$ $\mathrm{mmol})$, triethylamine ( $1.17 \mathrm{~mL}, 8.42 \mathrm{mmol}$ ), borolane $(0.94 \mathrm{~mL}$, 6.48 mmol ) and dichlorobis(triphenylphosphine)palladium(II) $(13.6 \mathrm{mg}, 0.02 \mathrm{mmol})$ were reacted according to 4.2 .2 . Column chromatography using dichloromethane as eluent yielded a purple solid ( $241.1 \mathrm{mg}, 56 \%$ ): $\mathrm{mp}>300{ }^{\circ} \mathrm{C} ; \mathrm{R}_{f}=0.2\left(\mathrm{SiO}_{2}\right.$, dichloromethane $/ n$-hexane $1: 2, \mathrm{v} / \mathrm{v}$ ); ${ }^{1} \mathrm{H}$ NMR ( 600 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta=2.75(\mathrm{~s}, 2 \mathrm{H}, \mathrm{N} H), 1.87\left(\mathrm{~s}, 12 \mathrm{H}, \mathrm{CH}_{3}\right), 7.78(\mathrm{~m}, 9 \mathrm{H}$, Ar- $H$ ), $8.24(\mathrm{~m}, 6 \mathrm{H}, \mathrm{Ar}-H), 8.85\left(\mathrm{dd},{ }^{3}=4.4,14.2 \mathrm{~Hz}, 4 \mathrm{H}, H_{B}\right)$, $9.00\left(\mathrm{~d},{ }^{3} J=4.6 \mathrm{~Hz}, 2 \mathrm{H}, H_{\beta}\right), 9.89 \mathrm{ppm}\left(\mathrm{d},{ }^{3} J=4.6 \mathrm{~Hz}, 2 \mathrm{H}, H_{\beta}\right) ;{ }^{13} \mathrm{C}$ NMR ( $150.9 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta=23.3,85.2,120.0,121.8,126.6$, 127.7, 134.5, 142.0, 142.4 ppm ; UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\text {max }}(\mathrm{lg}$ $\varepsilon)=417$ (5.4), 514 (4.3), 546 (4.0), 588 (4.0), 649 nm (3.9); HRMS(ES + ) $\left[\mathrm{C}_{44} \mathrm{H}_{38} \mathrm{~N}_{4}\right]$ calcd for $[\mathrm{M}+\mathrm{H}] 665.3088$, found 665.3109.
4.2.7. 2,6,14-[Tris(5,10,15-triphenylporphyrin-20ylato)nickel(II)]triptycene (7c)

The borolanylporphyrin 3b (1 eq.), 2,6,14-triiodotriptycene 2 (0.3 eq.), potassium phosphate (eq.) and tetrakis(triphenylphosphine)palladium(0) ( 0.1 eq.) were placed in a Schlenk tube and dissolved in anhydrous DMF under argon. The mixture was heated at $100{ }^{\circ} \mathrm{C}$ for 12 h . The solvent was removed and the residue was redissolved in dichloromethane and washed with aqueous sodium hydrogencarbonate solution. The crude product was purified by dry-loaded column chromatography on silica gel, dichloromethane : $n$-hexane $(1: 2, \mathrm{v} / \mathrm{v}, \mathrm{h}=53 \mathrm{~cm}, \varnothing=3 \mathrm{~cm})$ and gave the pure product as second fraction as orange crystals after recrystallization from dichloromethane/methanol ( $20.6 \mathrm{mg}, 0.01$ mmol, $22 \%$ ). Alternatively, this compound was prepared by Suzuki coupling of the free base porphyrin 7b directly followed in situ by metallation with zinc(II)acetate and standard work up: $\mathrm{mp}>310^{\circ} \mathrm{C} ; R_{f}=0.47$ (dichloromethane $/ n$-hexane, $1: 1, \mathrm{v} / \mathrm{v}$ ) ${ }^{1} \mathrm{H}$ NMR (400 MHz, $\mathrm{CDCl}_{3}$ ): $\delta=5.96 \mathrm{ppm}(\mathrm{s}, 1 \mathrm{H}, \mathrm{CH}), 6.10(\mathrm{~s}, 1 \mathrm{H}$, $\mathrm{CH}), 7.71\left(\mathrm{~m}, 30 \mathrm{H}, \mathrm{Ar}_{H}\right), 8.05\left(\mathrm{~m}, 21 \mathrm{H}, \mathrm{Ar}_{H}\right), 8.18\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{Ar}_{H}\right)$, $8.25\left(\mathrm{~s}, 1 \mathrm{H}, \operatorname{Ar}_{H}\right), 8.33\left(\mathrm{~s}, 1 \mathrm{H}, \operatorname{Ar}_{H}\right), 8.78\left(\mathrm{~m}, 16 \mathrm{H}, H_{\beta}\right), 8.92 \mathrm{ppm}$ $\left(\mathrm{m}, 8 \mathrm{H}, H_{\beta}\right) ;{ }^{13} \mathrm{C}$ NMR (150.9 MHz): $\delta=53.97,54.01,118.83$, $118.84,118.87,118.91,118.96,122.43,126.69,126.71,127.56$, $129.43,131.16,132.02,132.06,132.29,132.36 .132 .42,133.57$, $138.02,140.80 \mathrm{ppm} ; \mathrm{UV} / \mathrm{vis}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\max }(\lg \varepsilon)=418$ (5.54), $528 \mathrm{~nm}(5.06)$; HRMS (LD+) $\left[\mathrm{C}_{134} \mathrm{H}_{80} \mathrm{~N}_{12} \mathrm{Ni}_{3}\right]$ calcd 2030.4689, found 2030.4669 .

### 4.2.8. 2,6,14-Tris[5-n-butyl-10,15-bis(4-methylphenyl)porphyrin-20-yl] triptycene (4c)

Produced from the borolanylporphyrin 4b following procedure given in 4.2.7. The crude product was purified by
column chromatography on silica gel dichloromethane : $n$-hexane $(1: 1, \mathrm{v} / \mathrm{v}, \mathrm{h}=31 \mathrm{~cm}, \varnothing=3 \mathrm{~cm})$ and gave the pure product as the sixth fraction as purple crystals after recrystallization from dichloromethane/methanol ( $8.9 \mathrm{mg}, 0.005 \mathrm{mmol}, 16 \%$ ): $\mathrm{mp}=237$ ${ }^{\circ} \mathrm{C} ; R_{f}=0.13\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}: n\right.$-hexane, $\left.1: 1, \mathrm{v} / \mathrm{v}\right) ;{ }^{1} \mathrm{H}$ NMR $(600 \mathrm{MHz}$, $\mathrm{CDCl}_{3}, 20^{\circ} \mathrm{C}, \mathrm{TMS}$ ): $\delta=-2.64 \mathrm{ppm}(\mathrm{s}, 2 \mathrm{H}, \mathrm{N} H),-2.61(\mathrm{~s}, 2 \mathrm{H}$, $\mathrm{N} H),-2.57(\mathrm{~s}, 2 \mathrm{H}, \mathrm{N} H), 1.16\left(\mathrm{t}, 12 \mathrm{H},{ }^{3} \mathrm{~J}=7.3 \mathrm{~Hz}, \mathrm{CH}_{3}\right), 1.85(\mathrm{~m}$, $6 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), $2.57\left(\mathrm{~m}, 6 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 2.77\left(\mathrm{~m}, 18 \mathrm{H}, \mathrm{C}_{6} \mathrm{H}_{5}-\right.$ $\left.\mathrm{CH}_{3}\right), 5.06\left(\mathrm{~m}, 6 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 6.13(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CH}), 6.26(\mathrm{~s}$, $1 \mathrm{H}, \mathrm{C} H), 7.61\left(\mathrm{~m}, 12 \mathrm{H}, \mathrm{Ar}_{H}\right), 8.14\left(\mathrm{~m}, 18 \mathrm{H}, \mathrm{Ar}_{H}\right), 8.48(\mathrm{~s}, 1 \mathrm{H}$, $\left.\mathrm{Ar}_{H}\right), 8.53\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{Ar}_{H}\right), 8.60\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{Ar}_{H}\right), 8.91\left(\mathrm{~m}, 5 \mathrm{H}, H_{\beta}\right), 8.99$ (m, 13H, $H_{\beta}$ ), $9.51 \mathrm{ppm}\left(\mathrm{m}, 6 \mathrm{H}, H_{\beta}\right) ;{ }^{13} \mathrm{C}$ NMR $(150.9 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right): \delta=13.97,14.06,21.41,22.54,23.51,29.21,29.56,31.79$, $35.11,40.75,54.17,119.25,119.46,116.53,120.29,122.34$, $127.19,128.69,130.47,130.75,132.04,134.33,137.05,137.08$, 137.15, 139.30, 139.43, 144.11, 144.87 ppm ; UV/vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ : $\lambda_{\text {max }}(\lg \varepsilon)=422$ (5.40), 446 (5.01), 518 (4.44), 554 (4.25), 593 (4.04), 649 nm (4.05); HRMS (ES+) $\left[\mathrm{C}_{134} \mathrm{H}_{110} \mathrm{~N}_{12}\right]$ : calcd for $[\mathrm{M}+2 \mathrm{H}] 1888.9133$, found 1888.9158 .

### 4.3. Determination of binding constants

Binding constants were determined by using the nonlinear least-squares program SPECFIT $/ 32^{\mathrm{TM}}$, which is a multivariate data analysis program for modeling and fitting experimental data sets (such as chemical kinetics and equilibrium titrations) obtained from multivariate spectrophotometric measurements.
