#### **Key indicators**

Single-crystal X-ray study T = 130 KMean  $\sigma(C-C) = 0.004 \text{ Å}$ R factor = 0.060wR factor = 0.134 Data-to-parameter ratio = 14.5

For details of how these key indicators were automatically derived from the article, see http://journals.iucr.org/e.

The crystal structure of the title compound, C<sub>34</sub>H<sub>31</sub>NO<sub>8</sub>, is stabilized by intramolecular C-H···O and N-H···O hydrogen bonds, intermolecular C-H···O hydrogen bonds, and  $C-H\cdots\pi$  and  $\pi-\pi$  interactions.

Received 1 August 2006 Accepted 19 September 2006

#### Comment

Pyrroles are both important natural products and crucial starting materials for the synthesis of porphyrins (Gossauer, 1974). In the context of ongoing studies on the hydrogenbonding pattern in pyrroles (Senge & Smith, 2005), dipyrromethanes (Senge, 2005) and porphyrins (Senge & Kalisch, 1999; Senge, 2000), we were interested in elucidating to what extent a compound such as (I), with many dipolar groups around the pyrrole ring, will participate in hydrogen-bonding interactions.

The compound forms one strong intramolecular hydrogen bond between the pyrrole NH group and atom O5 from one of the two benzyl ester groups at the vinyl substituent (Fig. 1 and Table 1). The seven-membered ring thus formed (H1/N1/C5/ C51–C53/O5) is almost planar, with an average deviation from the least-squares plane of 0.046 Å. Atom O2 of the ethyl ester lies also in this plane and is separated by only by 2.37 Å from H1. However, the O2-H1-N1 angle is 96° and outside the usual limits for a bonding interaction (Steiner, 1997). Thus, this orientation might be more the result of the C31-H···O1 interaction (Table 1). The other benzyl ester at the vinyl group is also fixed in a relatively coplanar arrangement with the vinvl group and the pyrrole ring. Here two weaker C-H···O3 interactions play a role. The stronger one of these is the interaction between the vinylic H51A and O3. Other close contacts, albeit with small bond angles, are C31-H31 $B \cdot \cdot \cdot$ O4, C51-H51 $A \cdot \cdot \cdot$ O8 and C518-H51 $I \cdot \cdot \cdot$ O8 (see Table 1).

In the crystal structure, the molecules are arranged in polymeric chains which are connected by a close inter-

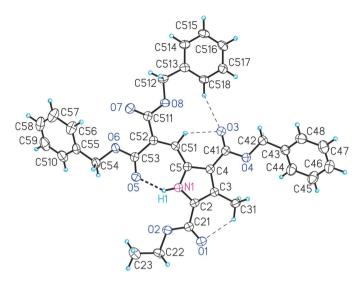

Figure 1

The molecular structure of (I). Displacement ellipsoids for the non-H atoms are drawn at the 50% probability level. The thick dashed line indicates a classical hydrogen bond  $N-H\cdots O$ ; thin dashed lines indicate the intramolecular  $C-H\cdots O$  interactions according to the criteria given by Steiner (1997).

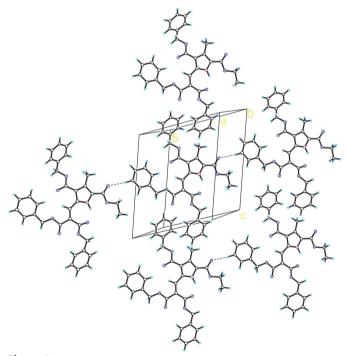

Figure 2 View of the molecular arrangement of (I) in the crystal structure. Dashed lines indicate intermolecular  $C-H\cdots O$  bonding interactions within a layer.

molecular contact (2.50 Å) between the aromatic hydrogen of C515 and O1<sup>ii</sup> and a C22···O1<sup>i</sup> contact. Table 1 ranks the different hydrogen-bonding motifs in the order suggested by Etter *et al.* (1990). In this order the nine different motifs can be described by the following graph sets:  $N_1 = S(7)$ ,  $N_2 = C(5)$ ,  $N_3 = C(14)$ ,  $N_4 = S(12)$ ,  $N_5 = S(5)$ ,  $N_6 = S(6)$ ,  $N_7 = S(5)$ ,  $N_8 = S(6)$ ,  $N_9 = S(6)$ . Further stabilization is achieved *via*  $\pi - \pi$  stacking of the pyrrole rings whose least-squares planes are separated by

3.32 Å and a benzylic  $CH_2$  benzene  $\pi$ -ring interaction. H54A is separated from the center of theC43–C48 phenyl ring by 2.69 Å.

# **Experimental**

Crystals were handled as described by Hope (1994). The compound was prepared as described by Senge & Smith (2005) and crystallized from CH<sub>2</sub>Cl<sub>2</sub>/n-hexane.

### Crystal data

$C_{34}H_{31}NO_{8}$	$V = 1455.5 (8) \text{ Å}^3$
$M_r = 581.60$	Z = 2
Triclinic, $P\overline{1}$	$D_x = 1.327 \text{ Mg m}^{-3}$
a = 8.966 (3) Å	Mo $K\alpha$ radiation
b = 12.037 (3)  Å	$\mu = 0.10 \text{ mm}^{-1}$
c = 14.349 (4)  Å	T = 130 (2)  K
$\alpha = 72.09 (2)^{\circ}$	Needle, colorless
$\beta = 83.67 (2)^{\circ}$	$0.40 \times 0.20 \times 0.16 \text{ mm}$
$y = 82.02.(2)^{\circ}$
